SUMMARY

Backend engineer with **1.3+ years** building fintech infrastructure at scale — from an audit-grade **Estimated Credit Loss (ECL) platform** to a **Treasury Management System** spanning 10+ banking integrations. Core stack: Python, Django, Celery, Redis, AWS, MySQL/MongoDB. Independently building RAG and agentic systems outside work, with a focus on retrieval architecture and LLM-provider abstraction.

EDUCATION

BITS Pilani Bachelor of Engineering Dec 2021 – May 2025

EXPERIENCE

NeoGrowth Credit Pvt. Ltd. Jun 2025 – Present
Software Developer

Estimated Credit Loss (ECL) Processing System *Fintech* *Django, Celery, Redis, AWS, MySQL, Pandas*

- Delivered an end-to-end **Estimated Credit Loss (ECL)** processing platform using **Django, Celery, Redis, MySQL, and Pandas**, fulfilling audit and regulatory reporting workflows and eliminating human intervention in the monthly ECL process.
- Built asynchronous file-processing pipelines using **AWS S3, Lambda, and SNS**, increasing throughput by **80%**, and optimized MySQL-backed reporting and validation modules, cutting report generation time by **40%**.

Treasury Management System (TMS) *Fintech* *Django, REST APIs, MySQL, Banking APIs*

- Developed a Treasury Management System to manage cashflows, fixed deposits, mutual fund investments, borrowings, and repayments. Systematized **90% of treasury operations** and eliminated **100+ daily manual entries**.
- Built backend modules and REST APIs for investment lifecycle management across **10+ banking integrations**, including account validation, penny-drop verification, and automated reconciliation — reducing operational errors by **60–70%**.

Data Dictionary & SQL-to-MongoDB Migration *Fintech* *Python, Django, MongoDB, MySQL*

- Developed Django management commands and background tasks to periodically crawl SQL and MongoDB schemas, **auto-detecting field-level structural changes** with zero downtime.
- Integrated Python migration utilities with **batch/chunk processing** to migrate high-volume datasets (> 10M records) from relational MySQL to MongoDB, ensuring memory efficiency and zero data loss.

PROJECTS

Stringer – News Digest Assistant 🐙 | *RAG, Python, FastAPI, ReactJS, NumPy*

- Built a **RAG-based** news assistant using **FastAPI** and a **NumPy cosine-similarity index over SQLite**, with hybrid retrieval (semantic + keyword + recency decay) and near-duplicate suppression across syndicated sources.
- Designed a grounding gate that withholds an answer rather than responding from unrelated articles, and an enrichment pipeline that fetches full article context to fix headline-only news feeds.

AI-Powered Recruitment Management Platform | *Python, Django, Claude API, LangChain*

- Built an end-to-end AI recruitment system using the **Claude API** to auto-generate customized job descriptions from historical JDs, cutting JD creation time by **70%**.
- Designed an LLM-powered candidate screening engine with automated resume scoring and fit analysis, enabling talent specialists to process more applications daily.

TECHNICAL SKILLS

Languages	Python, C++, SQL, JavaScript
Backend & Frameworks	Django, FastAPI, REST APIs, Celery, Redis, Gunicorn, Nginx, ReactJS
Data & ML	Pandas, NumPy, SQLAlchemy, MySQL, MongoDB
Cloud & DevOps	AWS (S3, Lambda, SNS, Fargate), Git, Docker
AI & LLM Systems	RAG Architecture, LangChain, Vector Search, Multi-Provider LLM Integration, Claude Code
CS Fundamentals	Data Structures & Algorithms, System Design, OOP
